Choice Modelling Workshop
1–2 May, 2008
Brisbane, Australia

This presentation details the work and analysis presented in:

Campbell D., Hutchinson W.G., Scarpa R. (forthcoming) Using choice experiments to explore the spatial distribution of willingness to pay for rural landscape improvements.
Environment and Planning A.

Presentation outline

- 1 Introduction
 - Policy framework
 - Aims and motivation
 - Spatial issues and WTP
- 2 Data and methods
 - Data
 - Choice model
 - Spatial interpolation
- 3 Results
 - Choice model
 - Willingness to pay (WTP)
 - Spatial autocorrelation of WTP
 - Spatial interpolation of WTP
- 4 Conclusions
 - Conclusions

Policy framework

- Agri-environmental schemes have become an important component within the European Union's Common Agricultural Policy.
- Within this context, the Rural Environment Protection (REP) Scheme was introduced in the Republic of Ireland in 1994.
 - The Scheme provides incentives for farmers to maintain and improve the rural environment.

Aims and motivation

- Use choice experiments to elicit WTP for the landscape benefits resulting from the REP Scheme.
- Use geostatistical methods to extend across the whole of the study area the WTP estimates derived from the collected data.
- Highlight any inherently spatial patterns.

Why examine the spatial distribution of WTP?

- Aggregate measures of WTP can obscure local patterns of heterogeneity.
- Spatial analysis provides different insights about WTP—its distribution, regional and local outliers, regional trends, and the degree of spatial dependence.
- While calculating WTP is useful for policy evaluation, it is also useful to know its spatial distribution.
 - Locating areas of value allows more efficient targeting of efforts.

Variations of WTP across space

- Spatial variation in WTP may be a consequence of a number of factors.
 - The socio-demographic distribution of the population is likely to influence the geographic distribution of WTP.
 - Environmental non-market goods themselves are spatially arranged.

Identification of spatial patterns of WTP

- Comparing regional variations in choice models typically requires, either:
 - The estimation of separate models to be estimated for each region.
 - The inclusion of additional location variables in the choice model.
- Both can be adequately used to compare preferences across a relatively small number of regions—but are arguably less suited when the aim is to compare preferences across a relatively large number of regions.

Attributes

- Following a lengthy consultation process with policy experts and members of the general public the following attributes were developed.
 - Mountain Land.
 - Stonewalls.
 - Farmyard Tidiness.
 - Cultural Heritage.
- The cost attribute was described as an increase in the respondent's Income and Value Added Tax.

Farmyard tidiness: No action

Farmyard tidiness: Some action

Farmyard tidiness: A lot of Action

Choice task

	Option A	Option B	No Action
Mountain Land	 A Lot Of Action	 No Action	 No Action
Stonewalls	 A Lot Of Action	 Some Action	 No Action
Farmyard Tidiness	 A Lot Of Action	 Some Action	 No Action
Cultural Heritage	 A Lot Of Action	 Some Action	 No Action
Expected Annual Cost	€ 80	€ 20	€ 0

Sampling frame

- To achieve a spatially representative sample, the population was stratified according to five different community types within four standard areas within Ireland.
- Electoral Divisions were chosen within each stratum.
- Six individuals were sampled within each of the pre-selected Electoral Divisions.

Random parameters logit model

- Random parameters logit models provide a flexible and computationally practical econometric method.
- Such models also accommodate the estimation of individual-specific preferences by deriving the conditional distribution (within sample) on the choices (x_n and y_n) made by the each respondent, n .

Random parameters logit model (con'd)

- With knowledge of these parameters, individual-specific WTP estimates can be approximated by simulation as follows:

$$\hat{E}[WTP_n] = \frac{\frac{1}{R} \sum_R -\frac{\hat{\varphi}_n}{\hat{\gamma}_n} L(\hat{\beta}_{nr}|y_n, x_n)}{\frac{1}{R} \sum_R L(\hat{\beta}_{nr}|y_n, x_n)},$$

where $\hat{\varphi}$ are the landscape attribute parameters, $\hat{\gamma}$ is cost parameter, $\hat{\beta}$ is the vector of parameters, L is the logit probability and R is the number of simulated draws.

Random parameters logit model (con'd)

- To ensure non-negative WTP estimates all attributes are specified as random with constrained triangular distributions.
- The log-likelihood function is estimated with simulated Halton draws.

Kriging

- To elucidate the geographical dimension of WTP, the individual-specific WTP estimates are spatially interpolated.
 - With spatial interpolation, WTP values can be used as a method of benefit transfer by predicting WTP values for all locations in the study area.
- The interpolation method of ordinary Kriging is adopted because our *a priori* expectations of spatially autocorrelated WTP estimates.
 - It is based on the assumption that nearby values contribute more to the interpolated values than distant observations.

Kriging (con'd)

- The general Kriging formula used to interpolate the WTP values is formed as a weighted sum of the data:

$$\hat{Z} [WTP_0] = \sum_{i=1}^n \omega_i Z (WTP_i),$$

- where $\hat{Z} [WTP_0]$ is the predicted WTP estimate at an unsampled location, ω_i is an unknown weight for WTP at the i^{th} location, $Z (WTP_i)$ is the individual-specific WTP at the i^{th} sample point and n is the number of measured values.

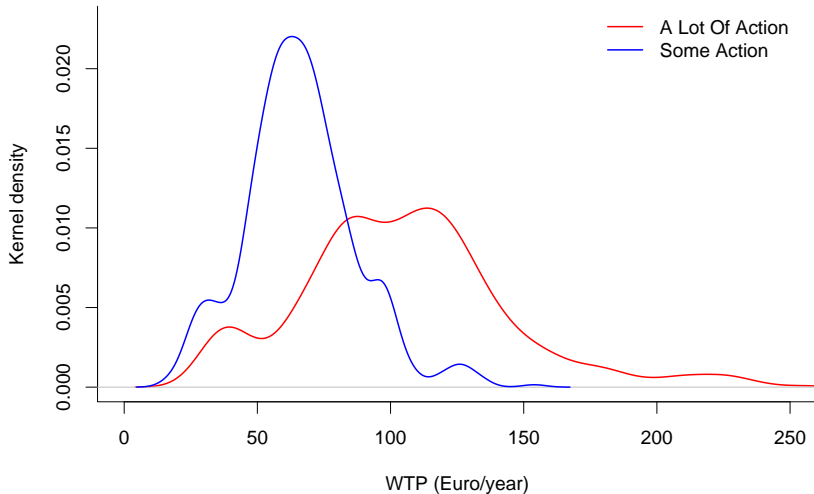

Random parameters logit model

	beta	t-ratio
Mountain Land: A Lot Of Action	1.041	12.2
Mountain Land: Some Action	0.598	10.1
Stonewalls: A Lot Of Action	0.870	14.9
Stonewalls: Some Action	0.531	9.5
Farmyard Tidiness: A Lot Of Action	0.794	14.1
Farmyard Tidiness: Some Action	0.502	9.2
Cultural Heritage: A Lot Of Action	0.587	10.2
Cultural Heritage: Some Action	0.577	9.9
Cost	-0.012	-10.6
\mathcal{L}		3,775
ρ^2		0.201

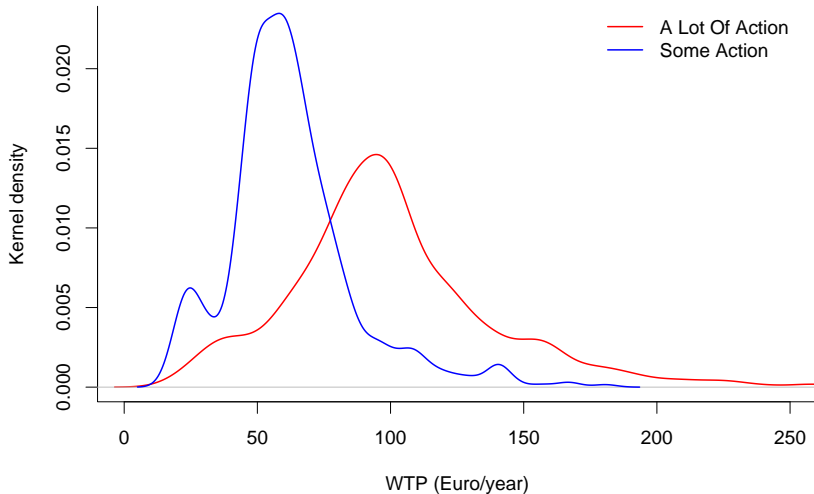

Individual-specific WTP: Mountain Land

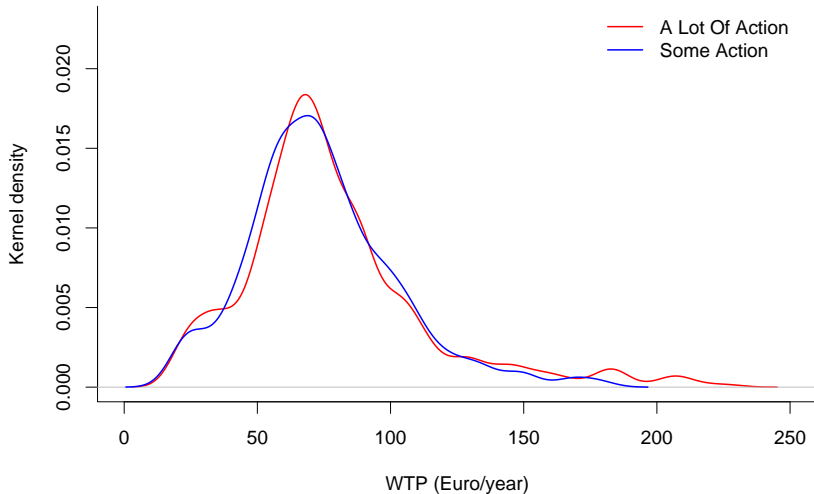

Individual-specific WTP: Stonewalls

Individual-specific WTP: Farmyard Tidiness

Individual-specific WTP: Cultural Heritage

WTP across EDs

	Mean (€)	Standard deviation (€)	Coefficient of variation (%)
Mountain Land: A Lot Of Action	135	42	31
Mountain Land: Some Action	76	14	19
Stonewalls: A Lot Of Action	104	23	22
Stonewalls: Some Action	65	11	17
Farmyard Tidiness: A Lot Of Action	99	21	22
Farmyard Tidiness: Some Action	61	13	21
Cultural Heritage: A Lot Of Action	78	21	26
Cultural Heritage: Some Action	73	15	21

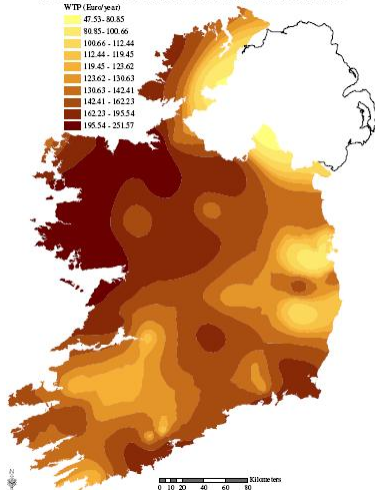

Spatial autocorrelation

	Moran's I^1	z
Mountain Land: A Lot Of Action	0.512	9.4
Mountain Land: Some Action	0.384	6.9
Stonewalls: A Lot Of Action	0.414	7.6
Stonewalls: Some Action	0.241	4.5
Farmyard Tidiness: A Lot Of Action	0.322	5.8
Farmyard Tidiness: Some Action	0.426	7.8
Cultural Heritage: A Lot Of Action	0.522	10.1
Cultural Heritage: Some Action	0.427	7.7

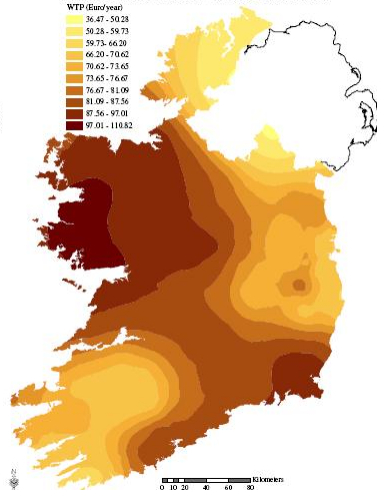

¹Moran's I is a spatial statistic used to determine spatial autocorrelation.

Spatial distribution of WTP: Mountain Land

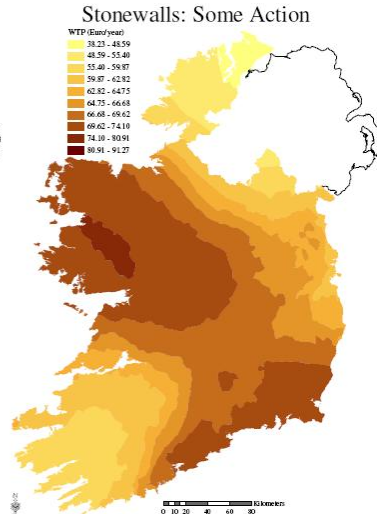

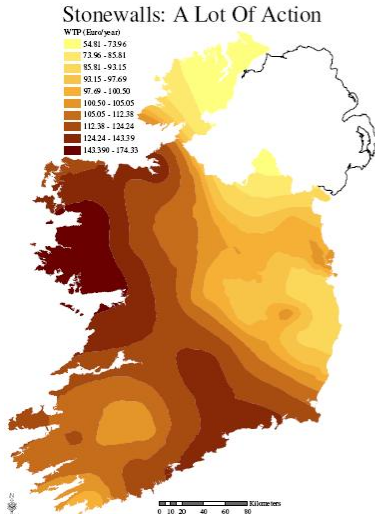

Mountain Land: A Lot Of Action

Mountain Land: Some Action

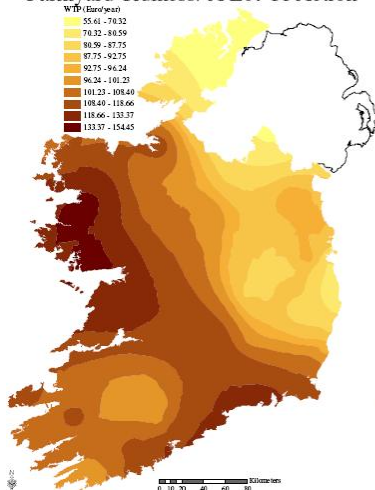

Spatial distribution of WTP: Stonewalls

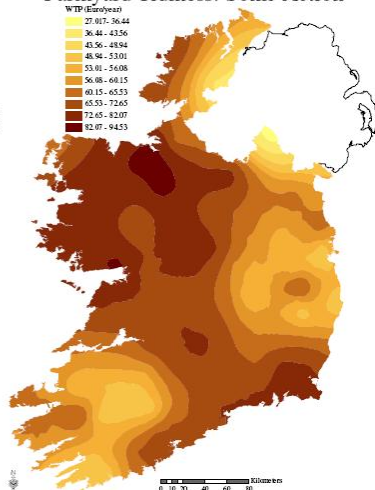

Spatial distribution of WTP: Farmyard Tidiness

Farmyard Tidiness: A Lot Of Action

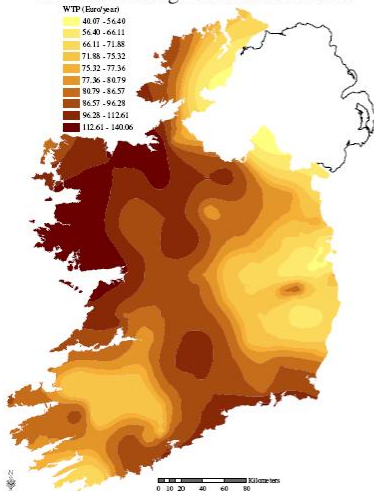

Farmyard Tidiness: Some Action

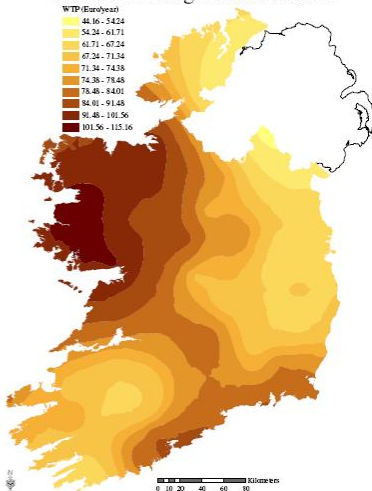

Spatial distribution of WTP: Cultural Heritage

Cultural Heritage: A Lot Of Action

Cultural Heritage: Some Action

Validation results for ordinary Kriging

Attribute	Mean error	Mean error (standardised)
Mountain Land: A Lot Of Action	0.915	0.004
Mountain Land: Some Action	0.508	0.028
Stonewalls: A Lot Of Action	0.713	0.019
Stonewalls: Some Action	0.269	0.023
Farmyard Tidiness: A Lot Of Action	0.682	0.028
Farmyard Tidiness: Some Action	0.443	0.022
Cultural Heritage: A Lot Of Action	0.560	0.008
Cultural Heritage: Some Action	0.357	0.016

Conclusions

- Mapping WTP estimates derived from discrete choice experiments is a valuable tool and adds considerably more explanatory power to the computed welfare estimates.
- Results indicate evidence of spatial dependence, thus indicating spatially dynamic intensities of tastes for the different rural landscape attributes.
- The results also have important policy implications.
